

DBS tray support set - CODE 910

By using the 120 PM 84 standard together with a tray support set, you are able to stack and to transport up to 20 large serving trays. The trays can be either oval or rectangular but must have a minimum width of 21 inches or 53 cm.

With this option it is possible to use the trolley for clearing tables or to create extra storage for plates, bowls and cups.

*Plate Mate:
the best solution
for all situations!*

DBS tray support set - CODE 910

ASSEMBLY

Place the adjustable screw pin at the bottom of the support set in the hole in the middle of the trolley base. This screw pin is adjustable to cover the height differences of different types of trays. There is a fitting on top of the rack to connect the tray support to the stainless tube. Turn the whole column until two of the black pins point at the tray support sets. There is a possibility that you may need to turn the whole column another 90° to ensure that the red shuttles are situated just above the layers of the rack. Then adjust the Plate Mate until the trays fit. The trays should be placed on the trolley starting at the bottom and moving up. This ensures the trolley remains stable.
